

Activity Marketplace Vendor Platform

Client Proposal and Screen-by-Screen Field Guide

This document explains the implemented vendor and administrator platform in business and technical terms. It maps each visible form field to its purpose, persistence behavior and downstream workflow.

1. Product Overview

Voya is a multi-tenant activity marketplace operating platform. Vendors manage their own company, compliance, activities, media, rate plans, inventory and bookings. Administrators review all vendors, inspect documents and control marketplace publication.

Role	Can do	Data boundary
Vendor	Manage onboarding, listings, rate plans, availability, pricing rules, bookings and vouchers.	Own vendor tenant only.
Administrator	Review all vendors, documents and activities; approve, suspend, verify, reject and publish.	Controlled cross-tenant governance.

End-to-end business flow

Vendor registration ? onboarding ? document upload ? catalogue creation ? rate plan ? date/slot availability ? admin review ? published activity ? booking ? voucher.

2. Vendor Onboarding Screen

This screen is the vendor readiness checklist. A fresh vendor uses it to create the minimum information needed for the platform to review and activate the account.

Figure 1. Current vendor onboarding screen from Chrome.

Field / control	Meaning	Saved / used by
Legal Business Name	Registered business name shown to administrators and on the vendor profile.	Vendor profile in PostgreSQL; admin vendor detail.
Operating City	Primary operating city for the supplier.	Vendor profile; catalogue location defaults.
Operating Region	State/region where activities operate.	Vendor profile and operational reporting.
GSTIN	Tax registration identifier.	Vendor profile and compliance review.
Category	Primary supplier category.	Vendor profile and catalogue classification.

Business Details save	Persists the business form and advances readiness.	Authenticated vendor API.
Document Upload / Replace	Selects GSTIN, PAN, bank proof or licence file.	File in public/uploads; URL, filename, status and timestamp in DB.
Bank / Payout fields	Account holder, bank, branch, IFSC, SWIFT, account type, currency and masked account.	Vendor payout profile; raw secrets are not exposed.
Continue / Save and Continue	Validates the current step and moves to the next onboarding step.	Onboarding status and readiness state.

3. Listings and Activity Form

Listings is the vendor catalogue home. The list shows persisted activities and provides New Listing and Add/Edit Activity. The editor is separated into seven sections so content, commercial rules and inventory remain understandable.

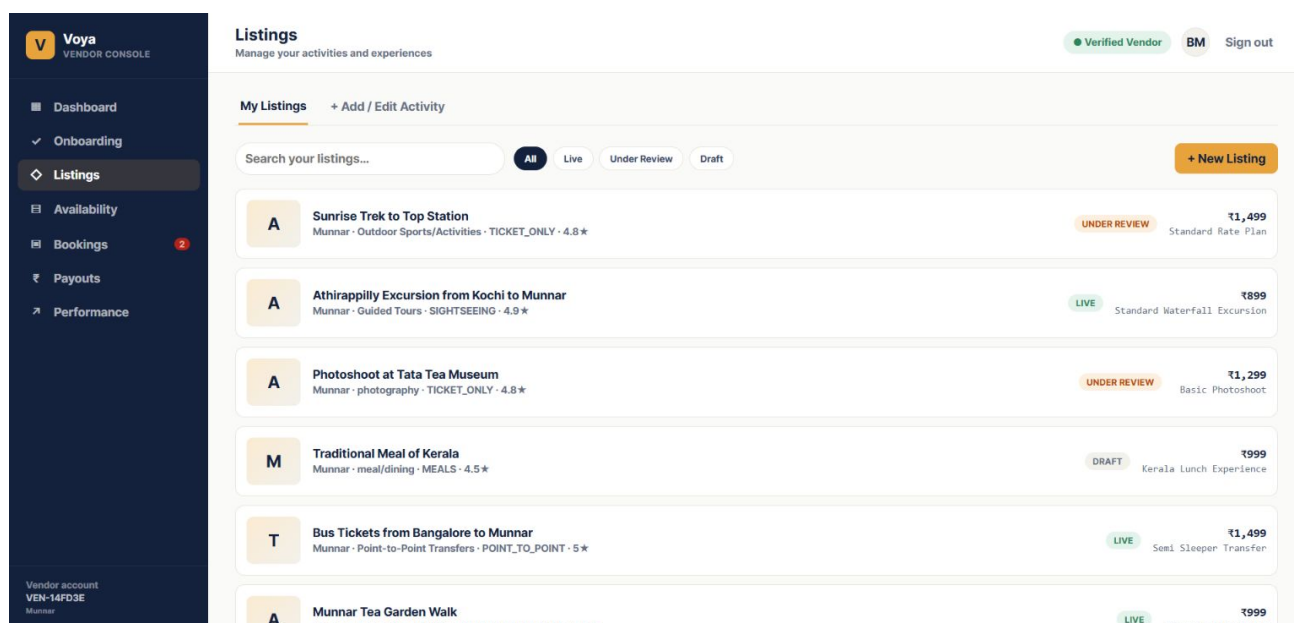

Figure 2. Current Listings screen from Chrome with filters and persisted activities.

Section / field group	Fields explained	Persistence / effect
Search and status filters	Search text; All, Live, Under Review and Draft.	Client-side/API filtering of activity records.
Basic Info	Product name, activity type, subtype, sub-category, star rating, short description, full description, highlights.	Activity master; highlights normalized as individual values.
Category & Location	City, state, country, meeting point/address, latitude and longitude.	Activity location and map/search context.
Media	Cover image, gallery images, media type, media URL, SEO description, remove/manage.	Files in public/uploads; media URLs and rank/order in DB; gallery supports multiple images.
Logistics & Inclusions	Things to carry and important information.	Activity operational instructions.
Rate Plan & Travellers	Plan name/code, dates, currency, unit type, base price, min/max pax and traveller age/count/price.	RatePlan and traveller-rule records linked to activity.
Policies & Cancellation	Terms and structured cancellation slabs per rate plan.	Cancellation-rule records; does not change slot inventory.
Availability & Promo	Entry point to date/slot inventory and promotion management.	Opens the separate Availability screen.

Save Draft / Publish workflow	Stores the form and sets the activity lifecycle state.	Admin review and publication queue.
-------------------------------	--	-------------------------------------

4. Availability & Pricing Screen

Availability is operated for one selected activity rate plan. The current layout displays the promotion summary, then rate-plan inventory controls and a read-only grid.

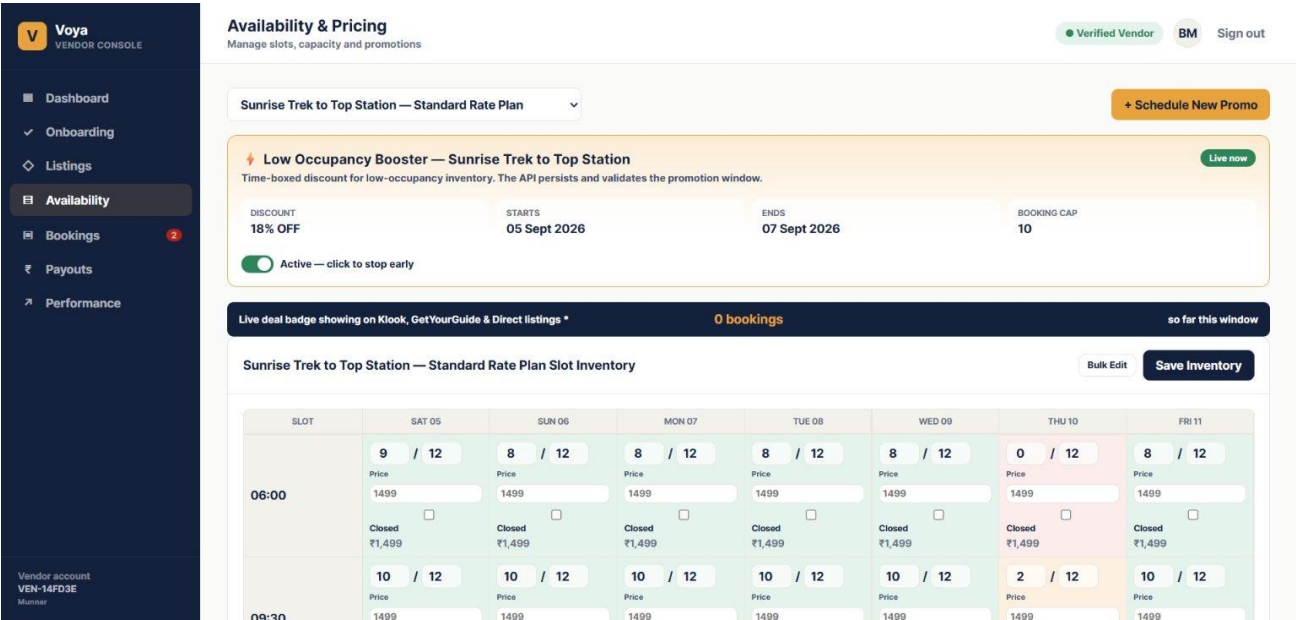

Figure 3. Current Availability & Pricing screen from Chrome, including the rate plan, promotion and slot inventory grid.

Field / control	Meaning	Update behavior
Activity / Rate Plan selector	Chooses which activity commercial plan is being edited.	All availability writes are linked to this rate plan.
Promotion summary	Discount, start date, end date, booking cap and active toggle for the displayed promotion.	Promotion record controls the time-boxed offer.
Slot selector	All Slots or one configured time such as 06:00, 09:00 or 10:00.	All Slots applies one value set to every slot; one slot targets only that slot.
From Date	First date in the update range.	Defines the first horizontally displayed date and save boundary.
To Date	Last date in the update range.	Defines the last displayed date and save boundary.
Free / Available	Number of currently bookable places.	Bulk-applied across selected slots and dates; validated not to exceed total.
Total	Maximum capacity for the selected slots.	Bulk-applied across selected slots and dates.
Price	Price override for the selected slots and dates.	Bulk-applied and stored with each availability row.
Update	Commits the compact value row.	Backend bulk upsert to PostgreSQL, then reloads the read-only grid.
Read-only grid	Date columns horizontally scroll; rows show slot, available/total, price and color status.	Display only; values come from saved API data.
Add Slot	Time picker used to create a new slot.	New time is saved, inserted into dropdown and selected.
Delete	Removes a configured slot.	Deletes the slot after confirmation and refreshes the grid.

Standing Pricing Rules	Name, applies-to, adjustment and active state.	Add/Edit/Delete/Active actions are database-backed pricing-rule records.
------------------------	--	--

5. Bookings and Voucher

Bookings is the vendor's operational queue. Filters separate all, needs action, confirmed and cancelled reservations. Voucher opens a backend-generated PDF.

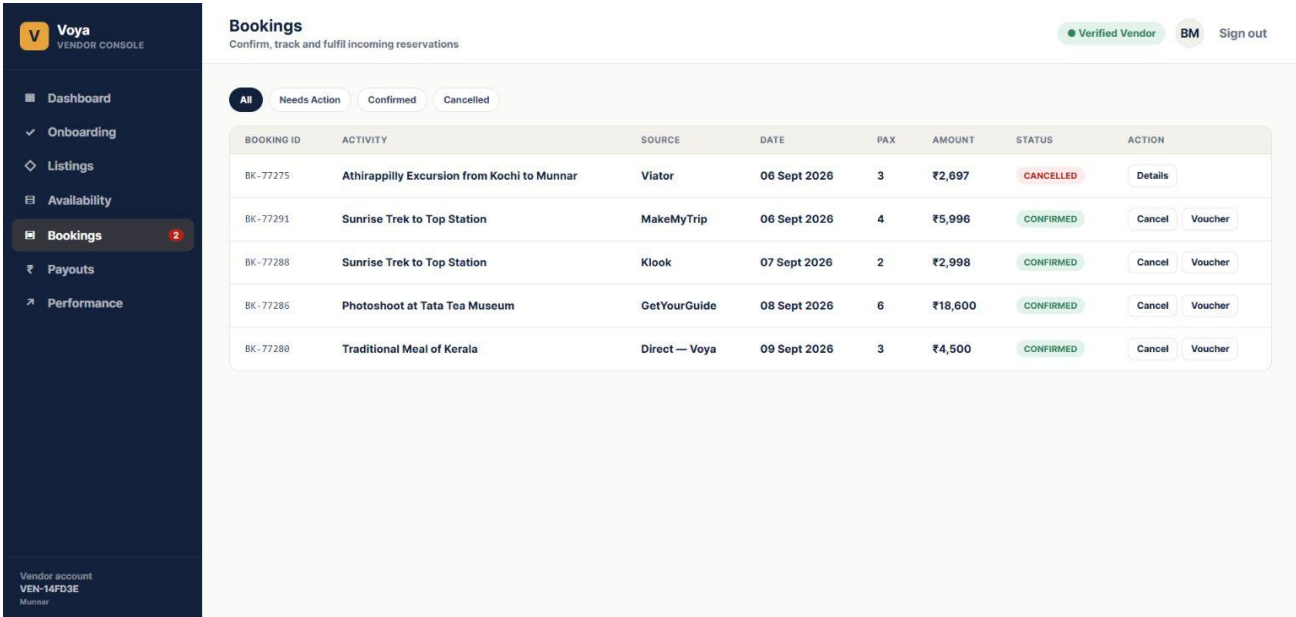

Figure 4. Current Bookings screen from Chrome.

Field / control	Meaning	Persistence / effect
Booking ID	Unique reservation reference.	Booking record and voucher lookup.
Activity	Booked product.	Links booking to activity and vendor tenant.
Source	Sales channel such as Direct, Klook or partner.	Reporting and channel attribution.
Date	Service date.	Inventory and fulfilment context.
Pax	Number of travellers.	Capacity validation and booking amount.
Amount	Calculated reservation amount.	Booking financial record.
Status / filters	Needs Action, Confirmed, Cancelled.	Status transitions through authenticated API.
Cancel	Cancels an eligible booking.	Persists cancellation and releases operational capacity as configured.
Voucher	Requests and opens voucher PDF.	PDF saved under public/uploads; returned URL opens in browser.

6. Administrator Screens and Controls

Administrators receive a separate menu and cross-tenant review surface. A vendor's uploaded document is visible to the administrator with preview and decision controls.

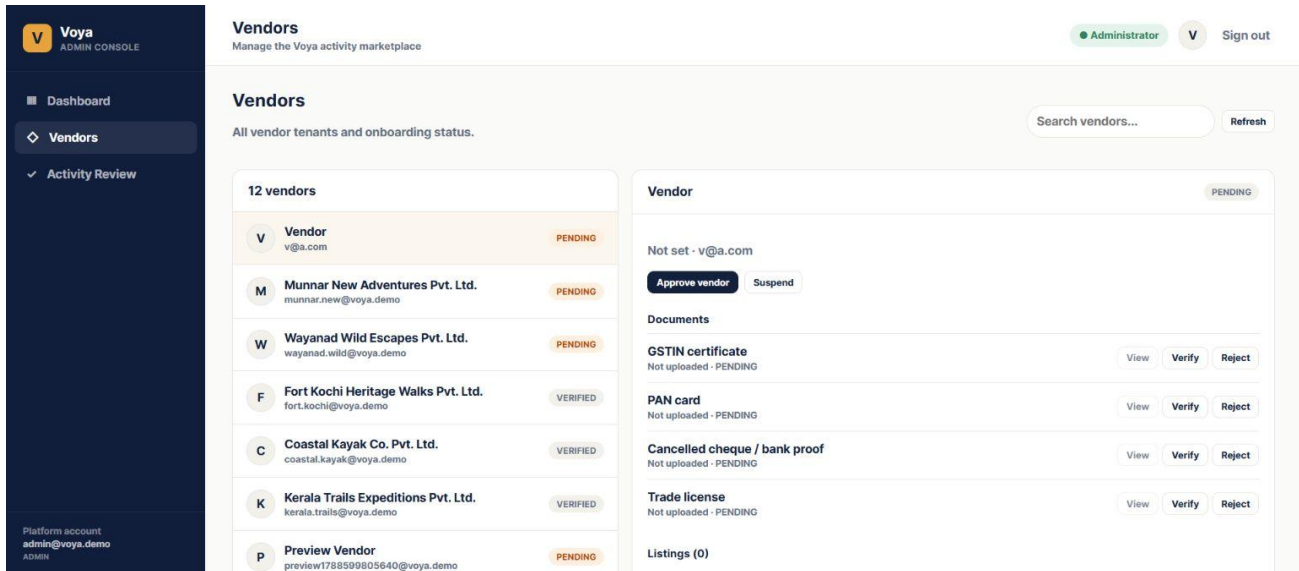

Figure 5. Current administrator vendor detail and document review screen from Chrome.

Admin field / action	Meaning	Result
Vendor search/list	Find vendor tenant by name or email and see pending/verified/suspended state.	Loads the selected vendor record.
Business/profile detail	Review legal identity, location, account and catalogue context.	Supports approval decision.
Approve vendor	Marks vendor ready for marketplace operations.	Persists vendor approval state.
Suspend	Stops vendor participation pending review.	Persists suspended state.
Document filename/status	Shows uploaded/not uploaded, pending, verified or rejected.	Reads document and review metadata.
View / Preview	Opens the image or PDF returned by the API.	Admin can inspect the actual uploaded file.
Verify	Accepts the selected document.	Persists verified status and review timestamp.
Reject	Rejects the selected document.	Persists rejected status for vendor correction.
Listings	Shows vendor activities and rate-plan count.	Leads to activity review/publication.

7. Technical Data Flow and Database

React renders the forms and read-only views. NestJS authenticates users, applies role and tenant checks, validates updates and returns API data. Prisma persists business records in PostgreSQL. Uploaded files are stored in public/uploads, while their references are kept in the database.

Object	Main relationships
Vendor / VendorProfile	Owns activities, documents, payout profile, bookings and payouts.
Activity	Owns media, rate plans and promotions.
RatePlan	Owns traveller rules, cancellation rules and availability rows.
Availability	One row per rate plan, slot and date with capacity, available, price override and closed state.
PricingRule	Activity-level editable rule with name, scope, adjustment, validity and active state.

Media / Document	Stores file metadata and URL/path reference to public/uploads.
------------------	--

The important trace is: form input ? authenticated endpoint ? validation/ownership check ? PostgreSQL/file storage ? API response ? refreshed screen. This is why Update, upload, Verify, Reject, Add Slot and pricing-rule actions remain after refresh.

8. Client Demonstration Script

1. Log in as a vendor and open Listings.
2. Open an activity and explain every editor section and field group.
3. Open Availability, select a rate plan and date range, leave All Slots selected, enter Free/Available, Total and Price, then click Update.
4. Show the refreshed read-only grid and horizontal date range. Add a slot and show it selected in the dropdown; demonstrate Delete.
5. Add or edit a Standing Pricing Rule and refresh.
6. Switch to Admin, open the vendor, preview an uploaded document, Verify or Reject it, then Approve or Suspend the vendor.
7. Open Activity Review and publish/reject the listing.
8. Return to Bookings and open a voucher PDF.

9. Implementation Position and Next Steps

Area	Position
Vendor/admin roles	Implemented and role-protected.
Onboarding, uploads and previews	Implemented with backend references.
Listings, multi-image gallery and rate plans	Implemented for current catalogue workflow.
Availability bulk update and slots	Implemented with PostgreSQL persistence and refreshed read-only grid.
Editable pricing rules	Implemented with Add/Edit/Delete/Active actions.
Bookings and vouchers	Implemented for vendor operating flow.
Remaining scope	Expose every remaining Activity Product Master field, then add production hardening, audit and regression automation.

This document reflects the current operating model and the current Chrome screen layout. The application is ready for a guided client demonstration of the vendor-to-admin marketplace lifecycle.
