

Voya Activity SaaS User Guide

What each screen does, how screens are linked, and what the fields mean

This guide explains the vendor portal in plain language. It follows the real application screens and shows how a vendor moves from onboarding to activities, rate plans, availability, bookings, payouts, and performance.

Quick start

Item	Value
Frontend	http://localhost:3007
Backend API	http://localhost:4007/api
Swagger	http://localhost:4007/api/docs
Demo email	vendor@voya.demo
Demo password	Demo@123

The browser application is the front door. It calls the NestJS API, and the API reads and writes PostgreSQL through Prisma. You normally work in the browser; pgAdmin is useful when you want to inspect the stored rows.

Technical architecture

The demo has three runtime layers. The React and Vite frontend runs on port 3007 and owns screen state, form controls, validation messages, and navigation. The NestJS backend runs on port 4007 under the /api prefix and owns authentication, role checks, validation, business rules, and database access. PostgreSQL stores the tenant, vendor, catalogue, pricing, inventory, booking, payout, and audit data in the activity_saas database.

Layer	Technology	Responsibility	Demo evidence
Browser	React + Vite	Renders screens, collects input, stores the JWT, calls API endpoints	Menu changes screens without a page reload
API	NestJS + class-validator	Authenticates requests, validates DTOs, applies workflow rules	HTTP status and error messages in the UI
Data access	Prisma ORM	Maps typed service calls to PostgreSQL rows and relations	Saved values remain after refresh
Database	PostgreSQL 16	Persists vendor-owned business data	Rows visible in pgAdmin under activity_saas

End to end technical flow

Use this sequence when demonstrating the system. Each step produces a visible result and a corresponding API or database change.

Step	User action	Frontend request	Backend and database result
1. Authenticate	Enter demo email and password and select Sign in	POST /api/auth/login	NestJS verifies the password and returns a JWT. The browser stores it as voya_token.
2. Restore session	Refresh the browser	GET /api/auth/me	The JWT guard identifies the user. The app then loads GET

			/api/vendor/profile.
3. Complete vendor setup	Edit business fields and select Save Business Details	PATCH /api/vendor/profile	VendorProfile is updated for the logged-in tenant only.
4. Verify documents	Choose a PDF, JPG, JPEG, or PNG in a document control	POST /api/vendor/documents/{key}	The document filename, status, and upload time are stored in VendorProfile.documentStatus.
5. Create catalogue content	Select Listings, New Listing, enter fields, and save	POST /api/activities or PATCH /api/activities/{id}	An Activity row is created or updated. Highlights, terms, location, rating, and information arrays are normalized.
6. Add commercial rules	Open an activity and add a rate plan	POST /api/activities/{id}/rate-plans	RatePlan is created with TravellerRule and CancellationRule child rows.
7. Publish	Select Publish Listing on a draft activity	POST /api/activities/{id}/publish	The activity status changes to LIVE in the demo workflow.
8. Manage inventory	Choose a rate plan, edit available/capacity/price/closed, and save	POST /api/availability/bulk	AvailabilitySlot rows are updated with version checks to prevent stale overwrites.
9. Manage demand	Schedule a promotion or toggle one off	POST /api/promotions or PATCH /api/promotions/{id}	Promotion stores its time window, percentage, cap, and active flag.
10. Fulfil bookings	Confirm, cancel, or request a voucher	POST /api/bookings/{id}/confirm, /cancel, or GET /voucher	Booking status transitions are validated. Confirmed bookings can return a voucher code.

Logical business flow

The business logic moves from identity to supply, then from supply to demand and settlement. The dependency is intentional: a booking is meaningful only when it points to an activity and, where applicable, a rate plan; an availability slot is meaningful only when it belongs to a rate plan.

Business object	Owns or belongs to	Why it matters
Tenant	Users, VendorProfile, Activities, Bookings, Payouts	Defines the vendor boundary used for isolation
VendorProfile	Business details and documentStatus JSON	Controls readiness, verification, and payout identity
Activity	Media, RatePlans, Promotions, Bookings	Represents the sellable product or experience
RatePlan	TravellerRules, CancellationRules, AvailabilitySlots	Represents a specific price and operating contract
AvailabilitySlot	One rate plan, date, and start time	Controls capacity, remaining inventory, closure, and optional price
Booking	One tenant, activity, optional rate plan	Represents a reservation and its state transition
Payout	One tenant and settlement status	Represents money moving through scheduled, transit, or paid states

State transitions to demonstrate

Object	Starting state	Action	Result
Activity	DRAFT	Submit for Review	UNDER_REVIEW
Activity	DRAFT, INACTIVE, or	Publish Listing in the vendor	LIVE

	UNDER_REVIEW	demo	
Activity	LIVE	Edit and save	UNDER_REVIEW, so changes are reviewed
Booking	PENDING	Confirm	CONFIRMED
Booking	PENDING or CONFIRMED	Cancel	CANCELLED
Promotion	active = true	Toggle switch	active = false
AvailabilitySlot	open	Set Closed and save	closed = true; inventory remains auditable

Tenant isolation and security flow

Every protected request carries Authorization: Bearer <JWT>. The JWT identifies the user role and tenantId. NestJS guards reject missing or invalid tokens, the roles guard limits vendor routes to vendor users, and service queries add the current tenantId to their filters. This is why one vendor cannot list or modify another vendor's activities, bookings, availability, or payouts. ValidationPipe rejects unknown fields and invalid types before the service writes data.

How the screens are linked

The left menu is available after login. Each menu item changes the main screen without changing the vendor account. Several screens are linked by IDs: an Activity owns Rate Plans; a Rate Plan owns Traveller Rules, Cancellation Rules, and Availability Slots; Bookings can refer to an Activity and Rate Plan.

Screen	Main purpose	What it links to
Dashboard	Summary of vendor activity	Bookings, Listings, Onboarding
Onboarding	Business verification and payout readiness	VendorProfile and documents
Listings	Search and open activities	Activity Editor and Rate Plans
Activity Editor	Create/edit product information	Media, Rate Plans, Availability
Availability	Set dates, slots, capacity and promotions	RatePlan and AvailabilitySlot
Bookings	Confirm or cancel reservations	Activity, RatePlan and Booking
Payouts	View settlement history	Payout
Performance	Review service quality	Dashboard and booking metrics

Login and dashboard

Figure 1. Exact login screen captured from the running Chrome application.

Enter the seeded demo email and password, then select Sign in. Authentication is performed by the NestJS API and the returned JWT is stored by the browser for authenticated requests; the React app does not fake a successful login.

Figure 2. Exact dashboard screen captured from the running Chrome application. The dashboard is the starting point after a successful login.

The dashboard gives a quick operational summary. Bookings Today counts recent booking activity, Revenue MTD shows confirmed and completed revenue for the month, Pending Bookings needs vendor action, and Vendor Readiness shows how complete the account is.

Onboarding

Voya Vendor Console

Complete verification to unlock full catalogue access

Verified Vendor BM Sign out

Onboarding

1 Business Details
2 Documents
3 Bank & Payout
4 Catalogue Setup
5 Go Live Review

Business Details

Legal Business Name: Blue Mountain Adventures Pvt. Ltd.

Operating City: Munnar

Operating Region: Kerala

GSTIN: 32AACCB1234F1Z5

Category: Trekking, Nature & Wildlife

Payout Account: HDFC **** 4821

Save Business Details

Documents

- GSTIN Certificate: Uploaded - Verified (Replace)
- PAN Card: Uploaded - Verified (Replace)
- Cancelled Cheque / Bank Proof: Required / pending (Upload)
- Trade License / Activity Permit: Required / pending (Upload)

Vendor account
VEN-14PQ38
Munnar

Figure 3. Exact onboarding screen captured from the running Chrome application.

Field	Meaning	Where it is stored
Legal Business Name	Registered business name	VendorProfile.legalBusinessName
Operating City / Region	Location used for vendor identity and operations	VendorProfile.operatingCity / operatingRegion
GSTIN	Tax registration identifier	VendorProfile.gstin
Category	Business category shown to the vendor	VendorProfile.category
Payout Account	Masked settlement account display	VendorProfile.payoutAccountMasked

Listings

Figure 4. Exact listings screen captured from the running Chrome application.

Listings is the activity catalogue. Use the search box to find an activity, use status filters to narrow the list, and click a listing card to open the Activity Editor. “Live”, “Under Review”, and “Draft” are workflow states. A listing price is taken from its first rate plan when one exists.

Activity editor

Figure 5. Exact Activity Editor screen captured from the running Chrome application.

Section	Important fields	What to enter
Basic Info	Product Name, Activity Type, Activity Sub-Type, Star Rating, Description	Customer-facing product identity and explanation
Category and Location	Sub-Category, City, State, Country, Address, Latitude, Longitude	Where the activity happens and how it is categorized
Media	Media Type, Media URL	Image or video URL for the product catalogue
Logistics	Things to Carry, Important Information	Operational instructions shown with the

		product
Rate Plan and Travellers	Rate plan code, currency, price, pax limits, traveller prices	Commercial offer that can be booked
Policies and Cancellation	Terms and cancellation slabs	Customer terms and charges based on days before service

Save Draft writes the activity to the database. Submit for Review changes a draft to Under Review. Publish Listing is available in the working demo and changes the listing to Live. Editing a live activity moves it back to review so production changes are checked.

Rate plans and traveller pricing

A rate plan is a bookable commercial version of an activity. One activity can have many rate plans, such as Standard, Private, Premium, Adult, Child, or different vehicle options. The activity is the product; the rate plan is the price and operating rules for that product.

Field	Meaning
Rateplan ID / Code	Unique code for the plan within its activity
Rateplan Name	Human-readable commercial name
Base Price	Default price stored as a database Decimal
Unit Type	Whether price is per person or per unit
Min Pax / Max Pax	Allowed booking group size
Valid From / Valid To	Date range when the plan can be used
Currency	Three-letter currency code used for the plan
Valid Days / Blackout Dates	Days the plan operates and dates that are excluded
Duration	Expected activity duration in minutes
Time of Day / Pickup Details	Operating time and meeting-point information
Pickup / Drop-off	Operational transport details
Inclusions / Exclusions	What is and is not included in the price
Traveller Rules	Adult, child, senior, and other age/price rules
Auto-Redeem Voucher	Whether the voucher is marked redeemed automatically
Cancellation Rules	Ordered slabs for cancellation charges

Availability and promotions

Figure 6. Exact Availability screen captured from the running Chrome application. The live demo contains at least 10 selectable rate plans with inventory.

Field	Meaning	Rule
Rate Plan Selector	Chooses which plan’s slots are being viewed	Only rate plans with seeded inventory appear
Slot Date	Service date	Stored as a date without a time of day
Start Time	Daily operating slot time	Combined with date and plan to identify a slot
Available	Remaining places for that slot	Must not be greater than capacity
Capacity	Maximum places for that slot	Used to protect inventory limits
Price Override	Optional slot-specific price	Otherwise the rate plan base price is used
Closed	Temporarily closes a slot	Closed slots cannot be sold
Promotion	Time-boxed discount for an activity	Has start, end, discount, and booking cap

Save Inventory sends the visible slots to the API. The backend uses optimistic version checks so a stale browser cannot silently overwrite another update.

Bookings

The screenshot shows the 'Bookings' section of the Voya Vendor Console. The left sidebar contains navigation links: Dashboard, Onboarding, Listings, Availability, Bookings (active), Payouts, and Performance. The main content area has a header 'Bookings' with a subtitle 'Confirm, track and fulfil incoming reservations'. Below this are filter tabs: 'All' (selected), 'Needs Action', 'Confirmed', and 'Cancelled'. A table lists five bookings with columns for Booking ID, Activity, Source, Date, Pax, Amount, Status, and Action. The status buttons are color-coded: red for 'CANCELLED', green for 'CONFIRMED', and orange for 'PENDING'.

BOOKING ID	ACTIVITY	SOURCE	DATE	PAX	AMOUNT	STATUS	ACTION
BC-77275	Athirappilly Excursion from Kizhi to Munnar	Viator	06 Sept 2026	3	₹2,697	CANCELLED	Details
BC-77295	Sunrise Trek to Top Station	MakeMyTrip	06 Sept 2026	4	₹5,996	CONFIRMED	Cancel
BC-77288	Sunrise Trek to Top Station	Klook	07 Sept 2026	2	₹2,998	PENDING	Confirm Cancel
BC-77286	Photoshoot at Tata Tea Museum	GetYourGuide	08 Sept 2026	6	₹18,600	PENDING	Confirm Cancel
BC-77288	Traditional Meal of Kerala	Direct — Voya	09 Sept 2026	3	₹4,500	CONFIRMED	Cancel

Figure 7. Exact Bookings screen captured from the running Chrome application.

Use All, Needs Action, Confirmed, and Cancelled filters to manage incoming reservations. A pending booking can be confirmed or cancelled. Confirmed and completed bookings expose Voucher. The API protects valid state transitions and keeps booking records isolated to the vendor tenant.

Payouts and performance

The screenshot shows the 'Payouts' section of the Voya Vendor Console. The left sidebar is identical to the Bookings screen, with 'Payouts' now selected. The main content area has a header 'Payouts' with a subtitle 'Track earnings and settlement cycles'. Below this are three summary cards: 'AVAILABLE / SCHEDULED' (₹1,84,220), 'IN TRANSIT' (₹42,900), and 'RECENTLY PAID' (₹1,26,500). Below the cards is a 'Settlement History' table with columns for Reference, Due Date, Amount, and Status.

REFERENCE	DUE DATE	AMOUNT	STATUS
PD-2026-001	09 Sept 2026	₹1,84,220	SCHEDULED
PD-2026-000	07 Sept 2026	₹42,900	IN TRANSIT
PD-2026-009	28 Aug 2026	₹1,26,500	PAID

Figure 8. Exact Payouts screen captured from the running Chrome application.

Figure 9. Exact Performance screen captured from the running Chrome application.

Payouts is read-only settlement history in this demo. Performance summarizes response time, cancellation rate, customer rating, readiness, and listing quality so the vendor knows what needs attention.

Recommended live demo script

This is a short logical demonstration for a stakeholder or tester. Keep the browser and pgAdmin open side by side when you want to prove that the UI change reached PostgreSQL.

Order	What to do	What to point out
1	Open http://localhost:3007 and sign in with <code>vendor@voya.demo / Demo@123</code>	The login is real and creates an authenticated session.
2	Open Onboarding and change the category, then save	The success message confirms the PATCH request; refresh to prove persistence.
3	Choose a pending document and select a file	The card changes to Uploaded and Verified with the filename.
4	Open Listings, select an activity, and review the editor sections	Basic information, location, media, logistics, rate plans, policies, and availability are linked by the activity ID.
5	Add or edit a rate plan	Explain currency, traveller prices, pax limits, valid dates, operating days, blackout dates, cancellation rules, and auto-redeem.
6	Select Publish Listing	The activity becomes LIVE in the demo and returns to the listing list.
7	Open Availability and choose one of the 10 seeded plans	Edit available seats, capacity, price override, and Closed, then select Save Inventory.
8	Schedule a promotion and toggle it	The time-boxed promotion is persisted and can be stopped or resumed.
9	Open Bookings and confirm a pending booking	The status changes to CONFIRMED; select Voucher to show the generated voucher code.
10	Return to Dashboard, Payouts, and Performance	These screens read summary and settlement data from the API and show the operational result.

How to verify the flow in pgAdmin

Connect to PostgreSQL 16, expand Databases, select activity_saas, then expand Schemas, public, and Tables. Right-click a table and choose View/Edit Data followed by All Rows. Useful tables for the demonstration are VendorProfile for onboarding and documents, Activity for listing fields and status, RatePlan for commercial rules, TravellerRule and CancellationRule for nested pricing rules, AvailabilitySlot for inventory, Promotion for discounts, Booking for confirmations and vouchers, and Payout for settlement history.

The strongest verification is to edit one value in the browser, save it, refresh the screen, and then open the corresponding table row in pgAdmin. The value should be identical because the browser does not use a mock-only form state for these persisted actions.

Database relationship in simple terms

The important chain is: Tenant → Vendor User and Vendor Profile. Tenant → Activities. Activity → Media, Rate Plans, Promotions, and Bookings. Rate Plan → Traveller Rules, Cancellation Rules, and Availability Slots. Booking can point back to the Activity and the selected Rate Plan.

When you use this screen	The main database row being changed
Save Business Details	VendorProfile
Save Draft / Edit Activity	Activity
Add Media	ActivityMedia
Create Rate Plan	RatePlan plus TravellerRule and CancellationRule
Save Inventory	AvailabilitySlot
Schedule Promotion	Promotion
Confirm or Cancel Booking	Booking

Troubleshooting

If the browser is blank, confirm the backend is running on port 4007 and the frontend on port 3007. If lists are empty, confirm the browser is logged in as vendor@voya.demo and that PostgreSQL database activity_saas is running. In pgAdmin, browse rows by expanding activity_saas → Schemas → public → Tables, then right-click a table and choose View/Edit Data → All Rows.
