

Voya Activity SaaS User Guide

What each screen does, how screens are linked, and what the fields mean

This guide explains the vendor portal in plain language. It follows the real application screens and shows how a vendor moves from onboarding to activities, rate plans, availability, bookings, payouts, and performance.

Quick start

Item	Value
Frontend	http://localhost:3007
Backend API	http://localhost:4007/api
Swagger	http://localhost:4007/api/docs
Demo email	vendor@voya.demo
Demo password	Demo@123

The browser application is the front door. It calls the NestJS API, and the API reads and writes PostgreSQL through Prisma. You normally work in the browser; pgAdmin is useful when you want to inspect the stored rows.

How the screens are linked

The left menu is available after login. Each menu item changes the main screen without changing the vendor account. Several screens are linked by IDs: an Activity owns Rate Plans; a Rate Plan owns Traveller Rules, Cancellation Rules, and Availability Slots; Bookings can refer to an Activity and Rate Plan.

Screen	Main purpose	What it links to
Dashboard	Summary of vendor activity	Bookings, Listings, Onboarding
Onboarding	Business verification and payout readiness	VendorProfile and documents
Listings	Search and open activities	Activity Editor and Rate Plans
Activity Editor	Create/edit product information	Media, Rate Plans, Availability
Availability	Set dates, slots, capacity and promotions	RatePlan and AvailabilitySlot
Bookings	Confirm or cancel reservations	Activity, RatePlan and Booking
Payouts	View settlement history	Payout
Performance	Review service quality	Dashboard and booking metrics

Login and dashboard

Figure 1. Exact login screen captured from the running Chrome application.

Enter the seeded demo email and password, then select Sign in. Authentication is performed by the NestJS API and the returned JWT is stored by the browser for authenticated requests; the React app does not fake a successful login.

Figure 2. Exact dashboard screen captured from the running Chrome application. The dashboard is the starting point after a successful login.

The dashboard gives a quick operational summary. Bookings Today counts recent booking activity, Revenue MTD shows confirmed and completed revenue for the month, Pending Bookings needs vendor action, and Vendor Readiness shows how complete the account is.

Onboarding

Figure 3. Exact onboarding screen captured from the running Chrome application.

Field	Meaning	Where it is stored
Legal Business Name	Registered business name	VendorProfile.legalBusinessName
Operating City / Region	Location used for vendor identity and operations	VendorProfile.operatingCity / operatingRegion
GSTIN	Tax registration identifier	VendorProfile.gstin
Category	Business category shown to the vendor	VendorProfile.category
Payout Account	Masked settlement account display	VendorProfile.payoutAccountMasked

Listings

Figure 4. Exact listings screen captured from the running Chrome application.

Listings is the activity catalogue. Use the search box to find an activity, use status filters to narrow the list, and click a listing card to open the Activity Editor. “Live”, “Under Review”, and “Draft” are workflow states. A listing price is taken from its first rate plan when one exists.

Activity editor

Figure 5. Exact Activity Editor screen captured from the running Chrome application.

Section	Important fields	What to enter
Basic Info	Product Name, Activity Type, Activity Sub-Type, Description	Customer-facing product identity and explanation
Category and Location	Sub-Category, City, State, Country, Address	Where the activity happens and how it is categorized
Media	Media Type, Media URL	Image or video URL for the product catalogue
Rate Plan and Travellers	Rate plan code, name, price, pax limits	Commercial offer that can be booked
Policies and Cancellation	Cancellation slabs	Charges based on days before service

Save Draft writes the activity to the database. Submit for Review changes a draft to Under Review. Vendors cannot publish directly; publishing is an admin action. Editing a live activity moves it back to review so production changes are checked.

Rate plans and traveller pricing

A rate plan is a bookable commercial version of an activity. One activity can have many rate plans, such as Standard, Private, Premium, Adult, Child, or different vehicle options. The activity is the product; the rate plan is the price and operating rules for that product.

Field	Meaning
Rateplan ID / Code	Unique code for the plan within its activity
Rateplan Name	Human-readable commercial name
Base Price	Default price stored as a database Decimal
Unit Type	Whether price is per person or per unit
Min Pax / Max Pax	Allowed booking group size
Valid From / Valid To	Date range when the plan can be used

Duration	Expected activity duration in minutes
Pickup / Drop-off	Operational transport details
Inclusions / Exclusions	What is and is not included in the price
Traveller Rules	Adult, child, senior, and other age/price rules
Cancellation Rules	Ordered slabs for cancellation charges

Availability and promotions

Figure 6. Exact Availability screen captured from the running Chrome application. The live demo contains at least 10 selectable rate plans with inventory.

Field	Meaning	Rule
Rate Plan Selector	Chooses which plan's slots are being viewed	Only rate plans with seeded inventory appear
Slot Date	Service date	Stored as a date without a time of day
Start Time	Daily operating slot time	Combined with date and plan to identify a slot
Available	Remaining places for that slot	Must not be greater than capacity
Capacity	Maximum places for that slot	Used to protect inventory limits
Price Override	Optional slot-specific price	Otherwise the rate plan base price is used
Promotion	Time-boxed discount for an activity	Has start, end, discount, and booking cap

Save Inventory sends the visible slots to the API. The backend uses optimistic version checks so a stale browser cannot silently overwrite another update.

Bookings

Figure 7. Exact Bookings screen captured from the running Chrome application.

Use All, Needs Action, Confirmed, and Cancelled filters to manage incoming reservations. A pending booking can be confirmed or cancelled. The API protects valid state transitions and keeps booking records isolated to the vendor tenant.

Payouts and performance

Figure 8. Exact Payouts screen captured from the running Chrome application.

Figure 9. Exact Performance screen captured from the running Chrome application.

Payouts is read-only settlement history in this demo. Performance summarizes response time, cancellation rate, customer rating, readiness, and listing quality so the vendor knows what needs attention.

Database relationship in simple terms

The important chain is: Tenant → Vendor User and Vendor Profile. Tenant → Activities. Activity → Media, Rate Plans, Promotions, and Bookings. Rate Plan → Traveller Rules, Cancellation Rules, and Availability Slots. Booking can point back to the Activity and the selected Rate Plan.

When you use this screen	The main database row being changed
Save Business Details	VendorProfile
Save Draft / Edit Activity	Activity
Add Media	ActivityMedia
Create Rate Plan	RatePlan plus TravellerRule and CancellationRule
Save Inventory	AvailabilitySlot
Schedule Promotion	Promotion
Confirm or Cancel Booking	Booking

Troubleshooting

If the browser is blank, confirm the backend is running on port 4007 and the frontend on port 3007. If lists are empty, confirm the browser is logged in as vendor@voya.demo and that PostgreSQL database activity_saas is running. In pgAdmin, browse rows by expanding activity_saas → Schemas → public → Tables, then right-click a table and choose View/Edit Data → All Rows.
